

HAND TIGHTENING OF HARDWARE IS RECOMMENDED!

Due to natural expansion and contraction of material, over-tightening may cause stress cracks. **DO NOT** use power tools, large wrenches or ratchets to tighten or install hardware. When installing hardware, hand tighten then “backoff” one quarter turn.

YES: Use bolt or screw that is smaller than diameter of hole to allow the material to expand and contract.

NO: If the bolt or screw is too tight the plastic has no room to expand and will thus cause cracking.
